

A Strategic Approach to Fire Safety

Al Carlo, Boeing

“Fire safety has improved significantly since the early years. The aviation industry has responded to smoke and fire related accidents with changes to enhance fire safety in cargo systems, seats, cabin materials, lavatories, insulation, and so on.

Industry is now at a point where significant fire accidents have become very infrequent. The fire safety strategy should be built around eliminating the daily events that will reduce the overall probability of the major low frequency accidents.”
