

Boeing Cargo MPS Halon Test Results

David Shaw

This presentation provides an overview of cargo compartment Minimum Performance Standard testing with Halon 1301 conducted in a new Boeing MPS test cell. The presentation includes an overview of the test conditions, procedures and results as well as a comparison of the test results to those published in FAA MPS document DOT/FAA/TC-TN12/11. The results of this testing establish a baseline for comparing the performance of alternative cargo fire suppression agents tested in the same test cell.
