

[SAE A-22] Development of AS6826/3: Fire Test Pass-Fail Criteria
[SAE A-22] Development of AIRxxxx: Assessment of Fire Test Results

Daniel Laborie (GE Aviation)

The SAE A-22 Committee is developing guidance to standardize the fire test pass-fail criteria for powerplant components. An information report is also created to illustrate how the industry has substantiated fire test anomalies such as post-test or back-side burning. Group members have contributed perspectives from aircraft manufacturers, nacelle manufacturers, engine manufacturers, system component manufacturers, and test facilities. Administrator representatives are also participating in the review and critique of the draft standard.
