Minimum Performance Standard
For Aircraft Cargo Compartment Built-In Fire Suppression Systems

WJH FAA Technical Center

Fire Safety Section, AAR-422 Atlantic City Int’l Airport, New Jersey 08405
OUTLINE

- INTRODUCTION
- AGENT SELECTION
  - Environmental
  - Toxicology
- TEST REQUIREMENTS
  - Test Cell
  - Instrumentation
  - Fire Tests Scenarios
  - Suppression System Design
- Acceptance Criteria
Federal Aviation Regulations and Joint Airworthiness Requirements, such as 25.851 - 25.857, require fire protection systems for Class C aircraft cargo compartments.

In the past, the aircraft industry has selected Halon 1301 total flood fire suppression systems as the most effective systems for complying with the FARs. But, it is an ozone depleting agent.

Because of the ban on production of Halon 1301 (Montreal Protocol, 1994), new fire suppression systems will need to be certified when the use of halon is no longer viable.
In 1994, the FAA sponsored International Halon Replacement Working Group created a task group to develop the MPS for aircraft cargo compartment.

The FAATC Fire Safety Section developed the standard, in conjunction with the IHRWG task group members, and ran the necessary tests to back the developed document.

The MPS document defines the fire test protocols required to test Halon 1301 replacements/alternatives.
ENVIRONMENTAL.
The replacement agent must be approved by the U.S. EPA under the Clean Air Act, Significant New Alternatives Policy (SNAP) Program, or other international governmental approving program.

The primary environmental characteristics to be considered in assessing a new agent are Ozone Depletion Potential (ODP), Global Warming Potential (GWP), and Atmospheric Lifetime.

TOXICOLOGY.
As a general rule, the agent must not pose an unacceptable health hazard to workers or passengers during installation, flight, and maintenance of the suppression system.
TEST CELL

The fire tests are to be conducted inside a simulated below floor cargo compartment of a wide-body aircraft.

Cargo Compartment = 2000 ft³

Leak Rate = 50 CFM ("U" Shape Ducts)

Instrumented with thermocouples, gas analyzers, and pressure transducers.
FORCED VENTILATION SYSTEM.
PERFORATED 4” DIAMETER DUCT.
DUCT OPENS TO OUTSIDE OF COMPARTMENT

Ceiling Thermocouples
Sidewall Thermocouple
Pressure Transducer
Gas Analyzer Probes

TEST CELL
INSTRUMENTATION

➢ Thermocouples –
  - Type K chromel/alumel, 22 gauge.
  - To be mounted 1.00” below the cargo ceiling with a maximum horizontal distance of 60.00”
  - To be mounted 12.00” below the ceiling on the sidewalls with a maximum horizontal distance of 60.00”
INSTRUMENTATION (CONT.)

- Fire Suppression Agent Analyzer –
  - Must be a continuous reading analyzer (at least 0.2 Hz)
  - Accuracy: +/-5% of reading
  - To measure the agent volumetric concentration, density, particle size, or any other type of measurable parameter.
  - Multiple vertical sampling probes (No averaging)
INSTRUMENTATION (CONT.)

- Pressure Transducer –
  - Frequency Response: at least 3000 Hz
  - Pressure Range: maximum 0-50 psig
FIRE SCENARIOS

- Bulk Load Fires
- Containerized Fires
- Flammable Liquid Fires
- Aerosol Can Explosion Simulation
Fire Load = 178 cardboard boxes (30% of Vol.) containing 2.5 lbs of shredded office paper (strips, not confetti) at standard room temp.

Boxes nominal dimensions:
18’x18”x18”

Fire Ignition = 7 ft of nichrome wire wrapped around four folded paper towels (Energized with 120 Vac) inside box (with 1” holes).

Fire Suppression System Activation = 1 minute after one of the ceiling T/C reaches 200 °F

Test Duration = Four tests @ 30 minutes each; fifth test shall for at least 180 minutes. Hybrid systems shall run for 180 min.
BULK LOAD

178 Cardboard Boxes
Fire Load = 33 card board boxes inside an LD3. 3 LD3 in Compartment

Two ventilation slots in main LD3 container size 12” x 3” +/-1/4 (access panel, and lower right panel)

The LD3 access panel is made out of 0.08” polycarbonate sheet

Fire Ignition = 7 ft of nichrome wire wrapped around four folded paper towels (Energized with 120 Vac)

FSS Activation = 1 min. after one of the ceiling T/C reaches 200 °F

Test Duration = Four tests @ 30 minutes each; fifth test shall for at least 180 minutes. Hybrid systems shall run for 180 min.
Cardboard boxes
Fire Load = 0.5 U.S. Gallon of Jet A fuel (with 13 oz of gasoline) inside a 2 ft x 2 ft x 0.33 ft pan

Add 13 oz of gasoline to make ignition easier; add 2.5 gallons of water to reduce pan warping.

Place pan in most difficult location (1 ft)

Fire Ignition = Arc created by two electrodes

FSS Activation = 1 min. after one of the ceiling T/C reaches 200 °F

Test Duration = 5 minutes after agent discharge
Not to scale
Fire Load:

**Simulator** - 0.2 lb. Propane, 0.6 lb. of denatured alcohol, 0.2 lb of water

**Cargo Bay** - 59 cardboard boxes

Ignition Sources = Nichrome wire/paper towel and electrodes (away from sim)

FSS Activation = 1 min. after one of the ceiling T/C reaches 200 °F

Heat up simulator to increase pressure in content chamber to 240 psig

Aerosol Can Simulator Activation = 5 minutes after one of the TCs, attached to the pipes, reaches 400 degF.

Test Duration = shall be conducted for at least 180 minutes or until the simulator is activated
AEROSOL EXPLOSION

Electrodes

Aerosol Can Simulator

8.5" long x 2" diameter Galvanized Steel Pipe with a thermocouple

Igniter Box

58 Cardboard Boxes

Aerosol Can Simulator
SHORT VERSION

Fire Load = 0.2 lb. Propane, 0.6 lb. of Denatured Alcohol, 0.2 lb of water

Ignition = Arc created by two electrodes (230 W) that are 2 ft from the floor and 3 ft away from the simulator

Test Initiation = Discharge agent and allow 2 minutes for dispersion

Simulator Activation = When the agent, at 2 feet from the floor, is at the minimum protection concentration (must be measured)

Test Duration = shall be conducted for at least 180 minutes or until the simulator is activated
SUPPRESSION SYSTEM DESIGN

- The FSS to be installed in an aircraft shall be based on the results of the MPS tests.

- The minimum agent concentrations that meet the MPS shall be measured objectively, not extrapolated.

- Extrapolation of data to account for the required duration and analysis for cargo load configurations are acceptable provided there is sufficient test data to support it.

- Airplane design initial knockdown and sustained agent concentrations for the duration of a diversion, accounting for leakage rates in an empty compartment, must be demonstrated to be equal to or greater than that established in the MPS.
SUPPRESSION SYSTEM DESIGN (CONT.)

- The method of measuring the concentration of agent in the required flight shall not use the arithmetic average of the gas analyzer probes.

- The following table provides a synopsis of the required airplane design minimum fire protection when associated with the four MPS test scenarios:

<table>
<thead>
<tr>
<th>MPS Test</th>
<th>Airplane Design Minimum Knockdown Concentration is MPS Test Demonstrated Maximum Concentration for Knockdown of:</th>
<th>Airplane Design Minimum Sustained Concentration is MPS Test Demonstrated Maximum Concentration to:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bulk-Load Test</td>
<td>Flames</td>
<td>Maintained Continued Fire Suppression</td>
</tr>
<tr>
<td>Containerized Test</td>
<td>Flames</td>
<td>Maintained Continued Fire Suppression</td>
</tr>
<tr>
<td>Surface Burn Test</td>
<td>Flames</td>
<td>Prevent Re-Ignition of Class-B Fire</td>
</tr>
<tr>
<td>Aerosol Can Explosion</td>
<td>Flames (Long Version)</td>
<td>Prevent Hydrocarbon Explosion</td>
</tr>
</tbody>
</table>
The minimum agent concentration (knockdown and sustained) or system configuration shall be dictated by the fire protection system performance during the MPS tests.

These minimum values will be based (measured objectively) on an empty 2000 ft³ cargo compartment.

The minimum selected value or configuration shall be the one that was capable of suppressing/inerting all of the four MPS fire threats.

Minimum agent concentrations/system configuration must be verified in a non-fire test in a discharge identical to the agent discharge in an actual fire test.
For Bulk Load, Containerized, Surface Burn Tests Only

$t_1 = \text{time when temperature } \geq 200^\circ \text{F}$

$t_2 = t_1 + 1 \text{ minute. Suppression System Activation}$

$t_3 = t_2 + 2 \text{ minutes; Data use for analysis}$

$t_4 = t_3 + 28 \text{ minutes or } t_4 = t_3 + \text{deviation time, End of test}$

Data range use for analysis
